For example, the central carbon atom bearing  $R_1$ ,  $R_2$  and  $NR_4R_5$  may have the R or S configuration. Compounds having the following 3-dimensional configuration are generally preferred:

- 3 -

Moreover, when the compounds of formula I include geometric isomers, the present invention embraces cis-compounds, trans-compounds and mixtures thereof. Similar considerations apply in relation to starting materials exhibiting asymmetric carbon atoms or unsaturated bonds as mentioned above, e.g. compounds of formula II, III or IV as indicated below.

In the compounds of formula I, the following significances are preferred individually or in any sub-combination:

1.  $R_1$  is  $\text{CH}_3$  or  $\text{CH}_2\text{-OH}$ ;

Removal of the protecting group may be carried out in accordance with methods known in the art. The removal of the amino protecting groups may conveniently be performed according to methods known in the art, e.g. by hydrolysis, e.g. in an acidic medium, for example using hydrochloric acid. Examples of protecting groups for amino groups are e.g. as disclosed in "Protective Groups in Organic Synthesis" T.W. a'

b'

to introduce the desired residue  $\text{R}_6$ .

Alkylation of the compounds of formula III may be performed according to methods known in the art, e.g. by nucleophilic substitution, e.g. by reaction with an alkylating agent  $\text{R}_6\text{-X}_3$  wherein  $\text{X}_3$  is mesylate, tosylate, triflate, nosylate or an halogen, e.g. chloride, bromide or iodide. The alkylation may also be carried out by following the Mitsunobu protocol (e.g. as disclosed in Hughes, Organic Preparations and Procedures International 28, 127-64, 1996 or D.L. Hughes, Org. React. 42, 335, 1992), in solution or on solid phase support synthesis, e.g. by attaching the compound of formula III to a resin. Alternatively, either triphenylphosphine or e.g. diethyl azocarboxylate bound to a resin, e.g. polystyrene, can be used.

The present invention also includes a process for the preparation of a compound of formula I which process comprises hydrolyzing the cyano group present in a compound of formula IV

wherein  $\text{R}_1$ ,  $\text{R}_2$  and  $\text{R}_5$  are as defined above,  $\text{R}'_3$  is  $-\text{A-B-CN}$  and  $\text{R}'_4$  is an amino protecting group, and, where required, converting the compounds of formula I obtained in free form into the desired salt form, or vice versa.

The compounds of formula I in free form or in pharmaceutically acceptable salt form, exhibit valuable pharmacological properties, e.g. lymphocyte recirculation modulating properties, e.g. as indicated in in vitro and in vivo tests and are therefore indicated for therapy.

#### A. In vitro

The compounds of formula I have binding affinity to individual human S1P receptors as determined in following assays:

#### Sphingosine-1-phosphate (S1P) receptor profiling

Agonist activities of compounds are tested on the human S1P receptors EDG-1 (S1P<sub>1</sub>), EDG-3 (S1P<sub>3</sub>), EDG-5 (S1P<sub>2</sub>), EDG-6 (S1P<sub>4</sub>) and EDG-8 (S1P<sub>5</sub>). Functional receptor activation is assessed by quantifying compound induced GTP [ $\gamma$ -<sup>35</sup>S] binding to membrane protein prepared from transfected CHO or RH7777 cells stably expressing the appropriate human S1P receptor. The assay technology used is SPA (scintillation proximity based assay). Briefly, DMSO dissolved compounds are serially diluted and added to SPA- bead (Amersham-Pharmacia) immobilised S1P receptor expressing membrane protein (10-20µg/well) in the presence of 50 mM Hepes, 100 mM NaCl, 10 mM MgCl<sub>2</sub>, 10 µM GDP, 0.1% fat free BSA and 0.2 nM GTP [ $\gamma$ -<sup>35</sup>S] (1200 Ci/mmol). After incubation in 96 well microtiterplates at RT for 120 min, unbound GTP [ $\gamma$ -<sup>35</sup>S] is separated by a centrifugation step. Luminescence of SPA beads triggered by membrane bound GTP [ $\gamma$ -<sup>35</sup>S] is quantified with a TOPcount plate reader (Packard). EC<sub>50</sub>s are calculated using standard curve fitting software. In this assay, the compounds of formula I have a binding affinity to S1P<sub>1</sub> receptor <50 nM.

Example	S1P <sub>1</sub> EC <sub>50</sub> [nM]	S1P <sub>3</sub> EC <sub>50</sub> [nM]	S1P <sub>4</sub> EC <sub>50</sub> [nM]	S1P <sub>5</sub> EC <sub>50</sub> [nM]
